Tribioscience

Bifidobacterium qPCR Kit (TBS42059)

Probe qPCR Detecting Bifidobacterium Species in One Reaction Tube

Catalog Number	Kit Size
TBS42059-100	100 assays
TBS42059-200	200 assays

DESCRIPTION

Bifidobacterium is a genus of gram-positive, anaerobic bacteria that inhabits the intestinal tracts of humans and animals. Bifidobacterium species are associated with improvements in intestinal barrier function and reduced inflammation. To ensure precise identification and monitoring of these beneficial bacteria, the bifidobacterium qPCR Kit provides a reliable solution.

Tribioscience's Bifidobacterium qPCR Kit has been designed specifically to identify bifidobacterium species in a single PCR reaction using real-time quantitative polymerase chain reaction (qPCR) and FAM labeled probe. The detection of target DNA confirms ingredient authenticity and prevents food fraud, ethical issues, environment, or health concerns.

Tribioscience's Bifidobacterium qPCR Kit includes all components for bifidobacterium amplification besides testing samples. The kit includes a qPCR super mix, the primer-probe mix labeled with FAM for the target gene, positive control, negative control, and PCR internal control labeled with Hex. This aids in a straightforward interpretation of the results.

Alternative name: Probiotic

KEY FEATURES

- ❖ High sensitivity and specificity for all bifidobacterium species.
- ❖ High efficiency: the optimal systemic conditions for PCR amplifications.
- ❖ Streamlined protocol: just add DNA Template and water.
- ❖ No cross reactivity with other species.

APPLICATIONS

Detect bifidobacterium-derived DNA in plants, ingredients, grain, food, herbals, and animal feed.

KIT CONTENTS

Name	100x rxn	200x rxn
qPCR Super Mix (BL1)	0.8mL	1.6mL
Primer-probe Mix (BL2)	0.6mL	1.2mL
Positive Control DNA (BL^+)	60µL	100µL
Negative Control DNA (BL^-)	60µL	100µL

The bifidobacterium target probe has been labeled with FAM while the PCR internal control has been labeled with Hex.

STORAGE CONDITION

The kit is shipped on ice and stored at -20°C for long-term storage. Shelf life of 12 months after receipt.

PCR PROTOCOL

DNA preparation is performed with suitable methods. We recommend our Microbial DNA Magnetic Extraction (TBS6025), and Dead Bacterial DNA Eraser (TBS6039).

1. Set up PCR reaction for each sample in 20µL

Reaction Component	Volume (µL)
qPCR Super Mix (BL1)	7.0
Primer-probe Mix (BL2)	5.0
Nuclease-free Water	3.0
DNA sample	5.0
Final Volume	20µL

Internal control should be included as below: Positive Control (5µL DNA/reaction) Negative Control (5µL DNA/reaction)

2. Suggested PCR conditions

Step	Amplification	PCR	
	HOLD	CYCLE (40x cycles)	
		Denature	Anneal/ Extend
Temperature	95°C	95°C	60°C
Time	1 min	15 sec	30 sec

DATA ANALYSIS

Positive Reaction: Sample Ct ≤ 37 w/ Positive, Negative and Blank controls normal.
Negative Reaction: Sample Ct ≥ 38 w/ Positive, Negative and Blank controls normal.
PCR internal control is positive in all samples, positive and negative controls. The positive response indicates a normal PCR amplification. Otherwise, the PCR reaction may be inhibited.
Repeat Reaction: If one of the control reactions is not normal, PCR reaction is failed and should be repeated.
